PHASES OF MOON

A natural satellite, or moon is a small body that orbits a larger one. There are at least 200 known moons in the solar system, but most of these orbit one of the giant outer planets. Within the solar system's inner region, there are only three moons. Mercury and Venus have none, Earth has "The Moon".

Mars has two irregularly shaped moons named Phobos and Deimos. Our moon is made of rock and metal. The composition of it is similar to the four inner planets. It has either little or no atmosphere. The lunar surface is covered with craters caused by asteroids, comets, and other space rocks.

By going through the phases of moon people understand that, There is a ray of light which comes from moon's surface further indicates positivity around us and rest of dark sky with cloudy effect give a indication of negativity involve, same when there is full positivity is surrounded by us negativity era first through their naked eye than seeing the positivity around them.

WANING CRESCENT

The moon is nearly back to the point in its own orbit where its dayside directly faces the sun and form a thin curve.

WAXING CRESENT

The silver of moon occurs when the illuminated half of the moon faces mostly away from the earth.

LAST QUARTER

The moon looks half illuminated from the perspective of earth, thus its illuminated by sun.

FIRST QUARTER

The moon is now a quarter way through its monthly journey and half of its illuminated side is visible. visible .

WANING GIBBOUS

The moon begins its journey back towards the sun ,the opposite side of the moon reflects the light.

WAXING GIBBOUS

Moon' s dayside has come into view and the moon brighter in the sky .

FULL MOON

The moon is fully illuminated from earth's perspective . This occurs when earth come between of the sun and moon.

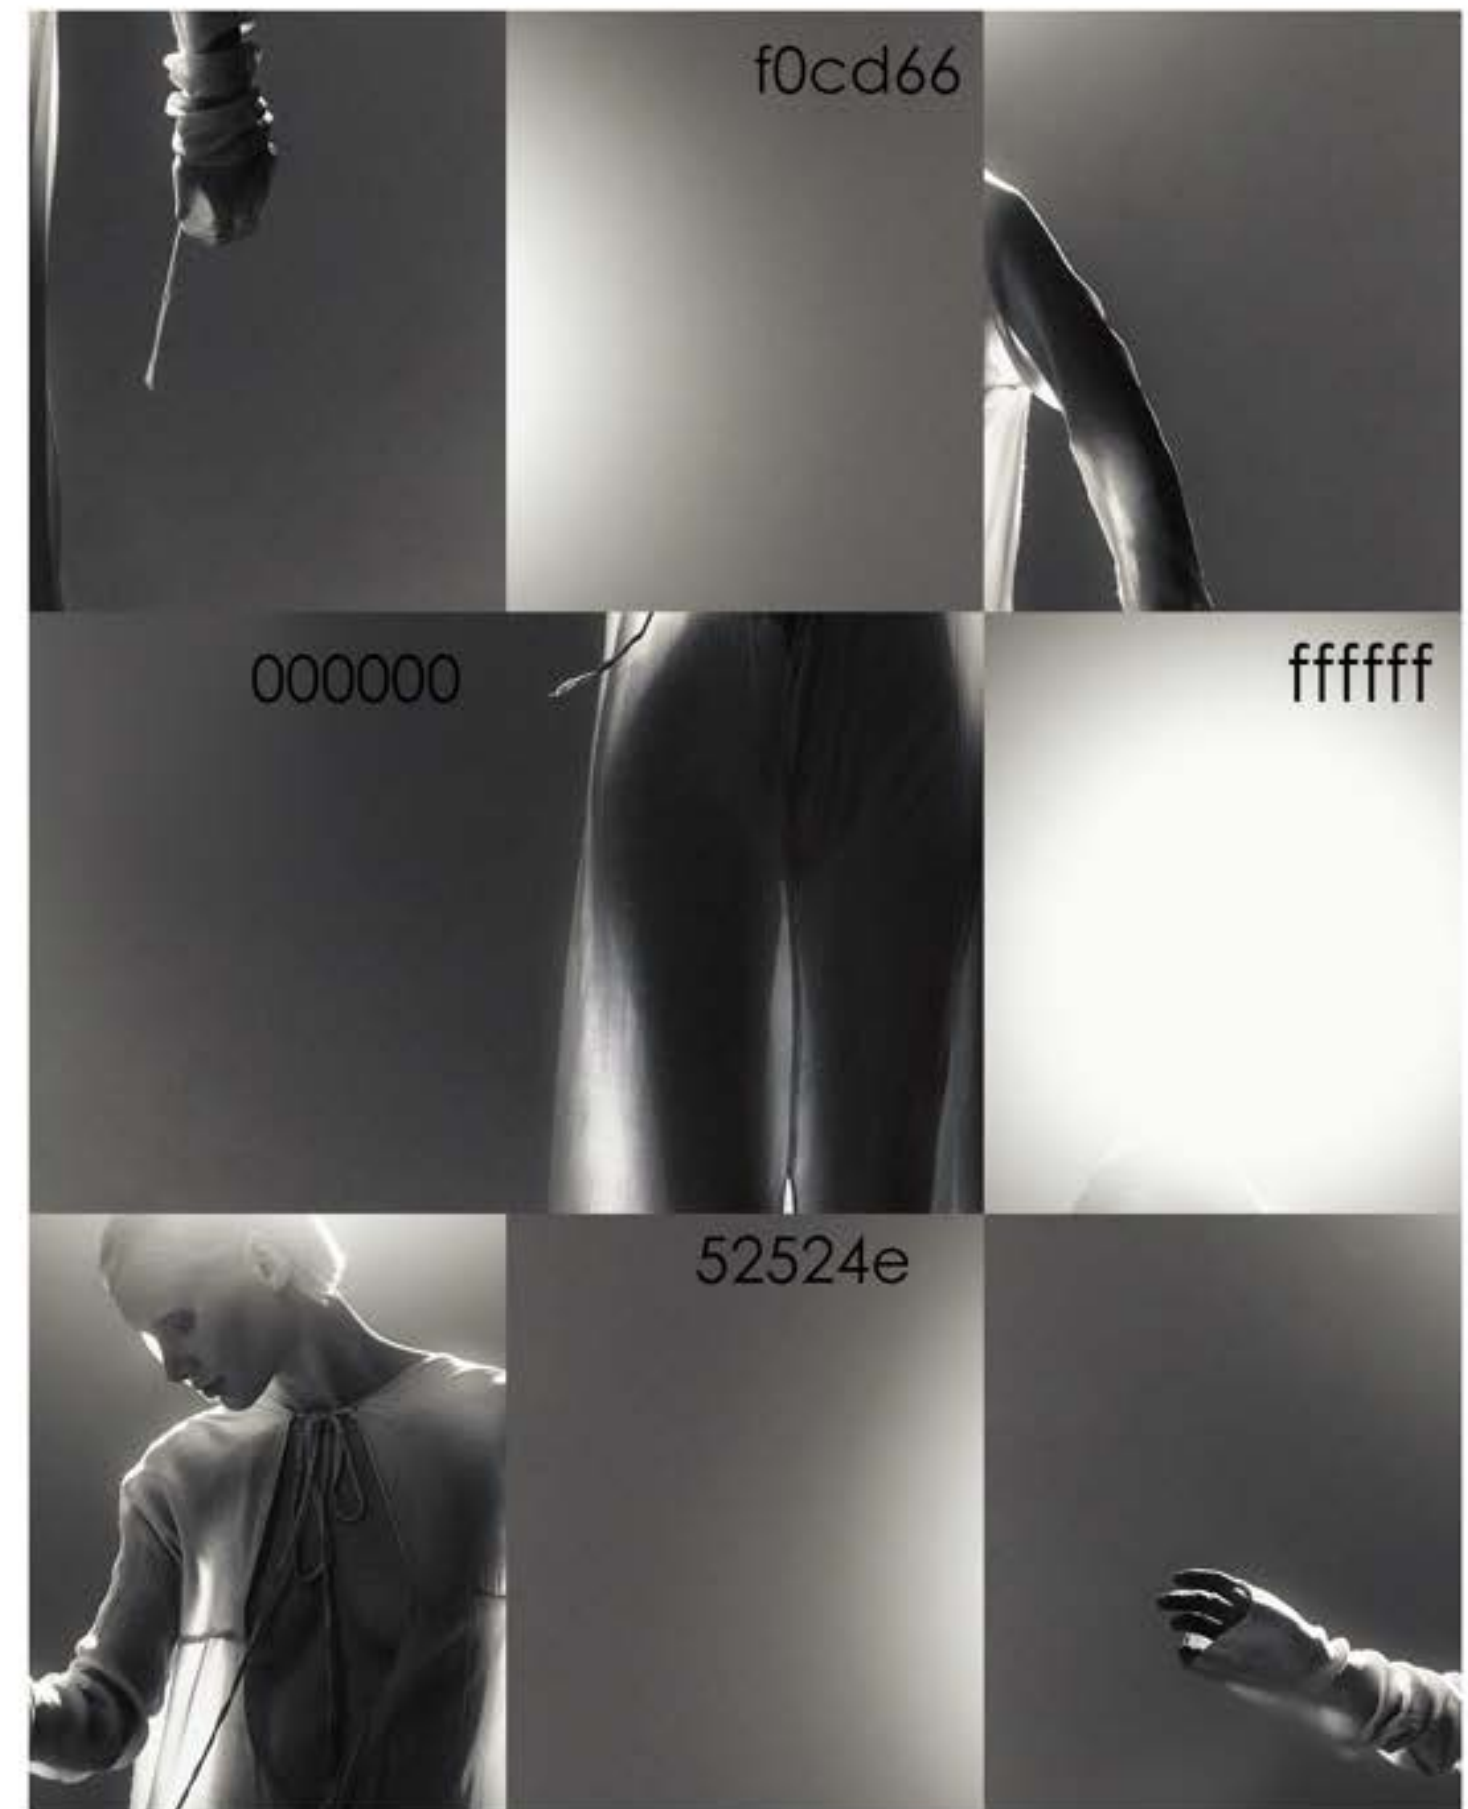

NEW MOON

This is invisible phase of moon , the moon usually pass directly between the earth and sun due to inclination of the moon's orbit
